CHARACTER FILM / 12 S / 16:9 / 30 FPS

No timeline grind. Just vibe.

Bro, the IdeaBro lightbulb, starts as a flat PNG layer inside a Vibe Editing comp. He peels himself off the screen, pops into 3D and builds a whole edit by jumping on the tools: Cut to beat, Captions, Motion GFX, a kicked-in look, four SFX stamps, a ride on the playhead, VIBE IT. Then the editor falls apart and only the finished reel is left. Interface, scene and sound come from the prompt on page 2 and are all driven by one timeline file.

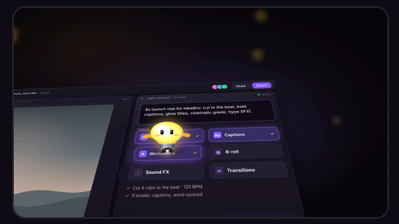

12.0 s	30 fps	1920×1080	11	524	3
120 BPM, 24 BEATS	360 FRAMES	2.5D: HTML + CSS 3D	BUTTONS, LOOKS, PLAYHEAD	WORDS OF PROMPT	FOLLOW-UPS

1.00 S FLAT PNG

2.10 S POP

3.50 S TOOLS

5.00 S KICK THE LOOK

7.00 S SFX STAMPS

9.00 S PLAYHEAD

THE FORMULA

01 Build the UI in HTML Real panels, labels and chips as a web page: crisp as a real app, and every pixel position is known.

02 One layout, three readers timeline.py holds every button in UI pixels; the HTML, the 3D world and the sound read the same numbers.

03 Slabs, not a screenshot Each panel is its own slab, so it can light up, press, power down and fall on its own.

04 The comp is a canvas The reel is drawn per frame from the playhead time, so cuts, captions and the grade follow real editor logic.

05 Every hop edits Each landing presses something that changes the comp and the timeline. A jump that changes nothing is cut.

06 Measure, don't guess 18 stills on one contact sheet before the full render; loudness per half second for the mix.

The prompt

COPY-READY · 524 WORDS

Paste it as is into Claude Code (Opus 5.5, effort high) with Blender 5, Node with puppeteer and ffmpeg installed for the full 3D route. No GPU? The same prompt with FORMAT swapped (page 4) gives the 2.5D version in this folder.

```
BRAND
HERO: Bro, the IdeaBro Studio mascot as one smooth toy: a chunky lightbulb 9 units tall, glass body FFC93C with a warm
filament glow, chrome screw base, two short dark legs, two side nubs, two black eye slits, rosy cheeks, soft rounded bevels
APP: a pixel-faithful Vibe Editing workspace by IdeaBro Studio, dark violet theme: top bar (logo, File Edit Vibe View Help,
launch_reel.vibe, Share, Export), Media (four clips, bro.png, vibe_beat.wav and a Looks list: Teal & Orange, Film 35, Noir,
Pastel Pop, Mono Punch, VHS 89), Preview with transport and timecode, a Vibe Copilot panel with a typed prompt, six tool
chips (Cut to beat, Captions, Motion GFX, B-roll, Sound FX, Transitions), a log and a big VIBE IT button, and a Timeline
with MG, CAP, V1, SFX and A1 tracks. Real layout and labels, no other logos
RESULT: the 8 s reel Bro builds: four clips cut on the beat, word-by-word captions "NO TIMELINE GRIND. / JUST TYPE THE VIBE.
/ AI DOES THE EDIT.", a VIBE EDITING title with a pen swoosh and a spark, a lower third, a 10x badge, a teal-and-orange
grade, four SFX hits, and an end card: VIBE EDITING / BY IDEABRO STUDIO
SET: every panel is a floating slab over a dark violet studio floor; the UI glows like a screen

FORMAT: Blender 5 Python, Cycles GPU, 1920x1080, 30 fps, 12.0 s at 120 BPM. Build the interface in HTML and screenshot it
with puppeteer into a 3840x2160 texture; draw the comp, the timeline clips and the timecode on a canvas, one PNG per frame.
One timeline.py holds the layout in UI pixels and every event; the HTML, the Blender scene and the sound all read it.

BEATS (seconds):
0-1.5 Bro is a flat bro.png layer in the comp, selection handles around him, the prompt types itself into Copilot; he knocks
twice from inside
1.5-2.0 peels off the screen as a flat card and pops into 3D; the preview glass cracks, shards fly
2.5-3.5 lands on Cut to beat, Captions and Motion GFX: each press drops clips on V1, captions on CAP, titles on MG, and the
comp updates
4.0-5.5 flips across the comp to Media > Looks, a Teal & Orange card pops up, he kicks it into the comp: the grade wipes
across
6.0-7.5 four hops along the SFX track; each stamps a hit on a cut and the comp jumps to it
8.0-9.6 hops on the playhead, it rewinds to 0, he surfs it to the end while the full edit plays
10-12 VIBE IT: flash, EXPORTED; every other panel powers down and falls away; Bro waves next to the finished end card

CAMERA: starts wide on the whole workspace, follows every hop at Bro height with shallow focus, whips to each button, ends
on the comp alone.

LOOK: UI as emission under black glossy glass; keep the lights out of the UI reflections so nothing blows out; bloom, 0.5
shutter blur, AgX; the glass body must read FFC93C, never orange.

CHECKS: render the UI texture and a comp contact sheet first, then 18 stills at half res before the full render.
```

BRAND

The block you swap. HERO, APP, RESULT, SET. The rest of the prompt only uses these names.

APP

Name every panel and the state it is in. The more real the labels, the more the film reads as your real product.

RESULT

Say exactly what the edit contains: the words of the captions, the look, the end card. Vague results give vague comps.

BEATS

Every hop lands on something that changes the comp. That is the whole pitch of Vibe Editing: one action, one finished layer.

LOOK

Glossy screens and big area lights fight. Keep the lights out of the UI reflections and name the hero colour in hex.

CHECKS

Makes the model look before it spends render time. Most of the polish comes from this line.

Every follow-up 3 ROUNDS

After each contact sheet, write what you see and what to change, in order. These are the notes from this build.

FOLLOW-UP 1 / AFTER THE FIRST 18 STILLS

The pop flash turns the whole frame grey: screen flash down to 0.14, comp flash to 0.35, VIBE IT flash to 0.2. The opening wide crops the timeline: dolly back to -450. On the timeline the camera leaves half the frame as empty floor: aim 120 px above Bro instead of 60. Bro hovers over the chips: feet at 28, not 36. The Teal & Orange card covers him: float it at x 268. His end wave barely reads: raise the arm to 1.95 rad. Land him at x 1395 so he stands beside the comp, not on it.

FOLLOW-UP 2 / AFTER THE FIRST MIX

The intro is as loud as the drop (-12 dB from frame 1), so the pop does not hit. Pads to 0.018 / 0.022 / 0.03 and intro hats halved. Result: -26 dB in the first half second, -19 on the knocks, -11 on the drop.

FOLLOW-UP 3 / AFTER THE FULL RENDER

Three misses. Mid-leap to Looks he flies out of the top of the frame: lower that apex from 230 to 150 and pull the camera back to -40. Two sub-frames per frame ghost the text on every whip instead of blurring it: render one sample per frame. The cut flash while he surfs washes the comp out: 0.55 to 0.35. Re-render the whole film (4 min on CPU); on a slow machine re-render only the ranges with `node render.js --from A --to B`.

5.40 s: the look wipes across the comp, ungraded on the right, Teal & Orange on the left.

7.00 s: third SFX stamp; the comp has jumped to the cut it marks.

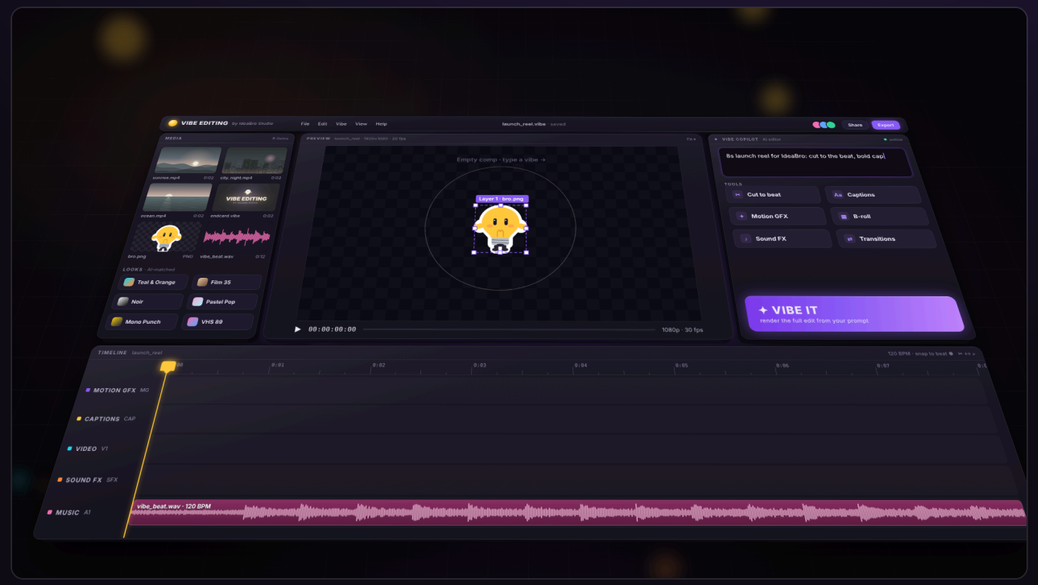

Make it yours, render it fast

Only the BRAND block changes. Swap APP for another Vibe Editing screen and RESULT for what Bro should make in it.

```
BRAND (example swap: podcast clips)
HERO: the same
APP: Vibe Editing in Podcast mode: a two-camera multicam bin, a
transcript panel with highlighted quotes, Copilot chips Find hooks,
Reframe 9:16, Captions, B-roll, and a Timeline with CAM A, CAM B, CAP
RESULT: three 9:16 shorts from one episode, each with a hook title,
karaoke captions and a punch-in on the best line
SET: the same
```

```
BRAND (example swap: product ad)
HERO: the same
APP: Vibe Editing with a 3D product shot, Brand kit and Music panels
RESULT: a 6 s ad: product spin, price tag pop, logo sting, CTA
```

```
FORMAT (2.5D swap, no Blender, no GPU: what this folder uses)
FORMAT: one HTML stage, 1920x1080, 30 fps, 12.0 s at 120 BPM: panels as
CSS 3D slabs over a floor, the comp on a canvas, Bro on a canvas
billboard, every frame from renderAt(t), screenshots with Playwright,
bloom and a soft vignette in ffmpeg.
```

The whole workspace from HTML before the camera moves: every label is real text.

RENDER IT FAST (2.5D, THIS FOLDER)

1. `python3 timeline.py`: layout and events to build/timeline.json.
2. `./make.sh stills`: 18 stills on one contact sheet. Read it, write a follow-up.
3. `./make.sh`: 360 frames (about 0.7 s a frame on 4 CPU cores, no GPU), the WAV, the MP4.
4. Encode: H.264 High CRF 17, 30 fps, bloom + soft vignette, WAV muxed as AAC 320k, +faststart.

BLENDER ROUTE

Build the .blend with `blender -b --factory-startup -P scene.py`, preview 18 stills at 50 % and 40 samples, pass `-P gpu.py` on every render: the OptiX device is a user preference, not part of the file.

Every hit on its frame

Read straight from timeline.py; the frame is time x 30 + 1. At 120 BPM a beat is 0.5 s, so every landing, press and stamp sits on one.

TIME	FRAME	PICTURE	SOUND
0.00 to 1.50 s	f1 to f46	wide on the workspace; flat Bro in the comp, handles around him, the prompt types, two knocks	soft pad, ticking hats, key taps, two glass knocks
1.50 to 1.90 s	f46 to f58	he peels up off the screen as a flat card	sticker peel, riser
2.00 s	f61	pop into 3D, the comp glass cracks, shards fly	pop, glass, sub boom, the beat drops
2.50 s	f76	Cut to beat: four clips snap onto V1, footage in the comp	click, blip, four snaps
3.00 to 3.50 s	f91 to f106	Captions: eleven word pills on CAP; Motion GFX: title, lower third, badge	click, blip, caption ticks; swish, sparkles
4.02 to 4.50 s	f122 to f136	flip across the comp onto Looks > Teal & Orange, the card pops up	boing, whoosh, landing, select blip
5.00 to 5.60 s	f151 to f169	kick, the card flies into the comp: the grade wipes across	thwack, whoosh, shimmer and bells
6.00 to 7.50 s	f181 to f226	four SFX stamps on the cuts, one a beat; the comp jumps to each	rising dings C E G C
8.00 to 8.40 s	f241 to f253	onto the playhead, it rewinds to 0	tape rewind chirps
8.50 to 9.60 s	f256 to f289	he surfs the playhead, the full edit plays	skate roll, scrub ticks
10.00 s	f301	VIBE IT: flash, particles, EXPORTED · 4K	click, kick, C major brass, shimmer
10.45 to 11.15 s	f315 to f335	every other panel powers down and falls	four power-downs, whooshes, boom
11.20 to 12.00 s	f337 to f360	Bro waves, ^^ eyes, the end card alone	yay chirps, sparkles, chord rings out, fade

3 TIPS

1 Pixels are the API Keep the layout in UI pixels; the stage, the camera and the sound all address buttons by the same numbers.

2 Show the editor logic Clips snap to V1, captions fill CAP, stamps jump the comp, the playhead plays it: anyone who edits smiles.

3 Every jump changes something A hop that presses nothing is filler; cut it or give it a button.

Sound

COPY-READY · 261 WORDS

The picture comes from the prompt on page 2; the sound comes from this one, driven by the same timeline.py.

```
Add sound. Synthesize everything in Python with numpy and scipy: no samples, no words. 48 kHz stereo WAV, 12.0 s, read every event from timeline.py and land each hit on its frame.

Music: a cute lo-fi beat at 120 BPM. Before the pop only a soft pad and ticking hats under the typing; the beat drops on the pop: kick, snare, hats, a rubbery bass on F G Am C, glassy FM keys on the off-beats, a kick pump on the bed. On VIBE IT a C major brass stab, then the chord rings out to a 0.5 s fade.

Effects: a key tap for every few typed letters, two glass knocks, a sticker peel and a riser, a pop with breaking glass and a sub boom; a boing on every take-off and a soft pomf on every landing, whooshes on the big leaps; a chunky click and a UI blip on each tool chip, four snaps as the clips land on V1, a tick for every caption, a swish and sparkles for the titles; a select blip for the look card, a thwack for the kick, a whoosh as it flies and a magic shimmer with bells for the grade; rising glockenspiel dings C E G C for the four SFX stamps; tape-rewind chirps, a skate roll and scrub ticks for the playhead; a power-down zap and a whoosh for each falling panel, a boom when they land; yay chirps and sparkles at the end.

Master: a compressor and a limiter at -1 dBFS. Print the loudness per half second.
```

THE CHECK · LOUDNESS PER HALF SECOND

-26 dB in the first half second, -20 to -17 dB through the knocks and the peel, then -14 to -11 dB from the pop to the end, and -21 dB in the fade. The drop lands where the picture explodes and nothing pokes out above the groove.

Into the MP4: the WAV is muxed in as the video's AAC 320k track with ffmpeg; the same step works for your own video.
